TITLE: Petroleum of new deposits in the Bashkirskaya ASSR

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 3, 1962, 452, abstract
p. 131 (St. "Khimiya seraorgan. soyedineniy, soderzhashchi kys v neftyakh i nefteproduktsakh. v. 4" M., Gostoptekhnizdat, 1961, 100-102)

TEXT: The result of analyses of petroleum of high sulfur content from different deposits of the Bashkirskaya ASSR shows that this petroleum can be divided into three groups according to the distribution of S among the fractions: (a) Petroleum with a small content of S in the gasoline fractions ($\leq 1\%$) and a gradually and uniformly increasing content in the kerosene fractions and in the diesel fuel oils. (b) Petroleum with low content of S in the gasoline fractions and with an infrequent increase of its content in the kerosene and diesel oil fractions. (c) Petroleum with considerable S content in the gasoline fractions ($\geq 0.5\%$) and with corresponding

Card 1/2

Petroleum of new ...

B149/B101

increase in the kerosene and diesel oil fractions. It is possible to manufacture fuels which comply with the CCT (GOST) from the first group of petroleum without any refining. Gasoline fractions of the second group are the only ones not requiring any further refining. Fuels manufactured from the third group all require special refining. [Abstracter's note:

TITLE: Petroleum from new fields in Bashkiria

SOURCE: AN SSSR. Bashkirskiy filial. Khimiya seraorganicheskikh soyedineniy, soderzhashchikhsya v neftyakh i nefteproduktakh, v. 6, 1964, 5-8:

TOPIC TAGS: petroleum, petroleum composition, petroleum physical property, Soviet petroleum, Bashkir petroleum

ABSTRACT: The authors report the results of analyses of petroleum from four new sites in the Bashkir ASSR, carried out in 1960. They found that Saitovskoye petroleum contains 2.73% S, 16.9% tarry silica gels and 7.5% asphaltenes. The density is 0.885 and the viscosity is 23.0 centistokes (at 20C). The light fractions up to 200 and 300C account for 21 and 37.3%, respectively. Nurskoye petroleum contains 3.94% S, 60% tars and 3% paraffins. The density is 0.923 and the viscosity is 145.3 centistokes. The yield of the 200 and 300C fractions is 12.8 and 24%, respectively. Stakhanovskoye petroleum contains 2.45% 2, 60% tars and 3.3%

Card 1/2

ACCESSION NR: AT4040447

paraffins. The yield of the 200 and 300C fractions is 21.4 and 36.8%, respectively. The presence of dissolved H₂S is characteristic of this petroleum. Voskresenskaya petroleum contains 1.32% S, 30% of the 200C fraction and 48% of the 300C fraction. The octane numbers of the distillates are 50-58. Possible industrial uses of the crude oils are discussed.

TITLE: Aromatic hydrocarbons in Arlan petroleum fractions obtained at 180-200 and 200-300C

SOURCE: Ufa. Bashkirskiy nauchno-issledovatel'skiy institut po pererabotke nefti. Trudy*, no. 7, 1964. Sernisty*ye nefti i produkty* ikh pererabotki (Sour crude oil and products of refining), 9-14

TOPIC TAGS: hydrocarbon, aromatic hydrocarbon, Arlan petroleum, alkylbenzene, tetra-substituted alkylbenzene, trisubstituted alkylbenzene, sulfur, absorption spectrum, aluminum oxide, chromatography, gas-liquid chromatography, petroleum refining

ABSTRACT: Arlan petroleum fractions obtained at 180-200 and 200-300C were investigated by gas-liquid chromatography. Tabulated data show that, in the 180-200C aromatic fraction, there was a considerable amount of tetrasubstituted alkylbenzene and a smaller amount of trisubstituted alkylbenzene. After removing the sulfur compounds from the 200-300C fraction, the product (accounting for 80.69% of the aromatic fraction) had the following characteristics: density 0.8904, refractive index 1.5082, molecular weight 193, sulfur content 0.02%. This fraction was then subjected to chromatography over aluminum oxide

Card 1/2

ACCESSION NR: AT4043271

and the mono and bicyclic aromatic hydrocarbons were separated. The monocyclic hydrocarbons were chromatographed again to yield narrow fractions based on the refractive index, and these narrow fractions were subjected to vacuum fractionation to obtain still narrower fractions. Finally, the structural composition of five-degree fractions was determined by absorption spectra over an ultraviolet light range of 230-290 m μ . Spectral analysis of the narrow fractions obtained from a fraction with a refractive index n_D^{20} of 1.51-1.52 showed that 1, 3-, 1, 3, 5- and tetraalkyl-benzenes also predominate in these fractions. The narrow five degree fractions obtained from fractions with $n_D^{20} = 1.50-1.51$ and $n_D^{20} = 1.51-1.52$ had a very similar structural composition. Depending on the boiling temperature and molecular weight, the hydrocarbon fractions forming each structural group differ in chain length, degree of branching or ring formation of substituents. Orig. art. has: 3 figures and 4 tables.

TITLE: Quality of commercial Romashkin petroleum

SOURCE: Ufa. Bashkirskiy nauchno-issledovatel'skiy institut po pererabotke nefti. Trudy*, no. 7, 1964. Sernisty*ye nefti i produkty* ikh pererabotki (Sour crude oil and products of refining), 15-19

TOPIC TAGS: petroleum, Romashkin petroleum, sulfur content, octane rating, petroleum residue, petroleum refining

ABSTRACT: It was found experimentally that the sulfur content of Romashkin petroleum had increased from 1.6% (in 1956) to 1.8-2.0% (1962) due to a change in the proportion of crude oils from different sites within the Romashkin area. Since an increase in sulfur content markedly affects the quality of petroleum products, the 1962 petroleum sample was further investigated for sulfur content in the various fractions. Results are tabulated and the distribution of sulfur in narrow fractions is plotted against temperature (see the

Card 1/4

ACCESSION NR: AT4043272

Enclosure). The total content of fractions obtained at 200 and 300C remained almost unchanged, as did the octane characteristics of the benzene distillates obtained from the 1962 sample. Fractions above 270C had a higher sulfur content than in 1956. The sulfur content of the benzene fractions was low, while that of the distillates of diesel fuel and residues was increased. An increase in the sulfur content of commercial petroleum by 0.26% causes the yield of white products to decrease by 1.5%. Investigation of the sulfur content in the petroleum residues showed that fractions taken below 350C had a lower sulfur content than specified by the standards, but higher by 0.5% than in the analogous residue from a 1956 sample. When processed in a cracking plant, this residue gave a low-standard fuel. The sorting of petroleum according to the sulfur content is absolutely essential for planning the adequate technological conditions to obtain high-grade products. Orig. art. has: 1 figure and 4 tables.

AUTHORS: Salamandra, G.D., Naboko, I.M. and Sevast'yanova, I.K.
TITLE: A Pulsed Source of Frequently Repeating Flashes of Light
(Impul'snyy istochnik chasto povtoryayushchikhsya
vspyshek sveta)
PERIODICAL: Pribory i tekhnika eksperimenta, 1959, Nr 2,
pp 124-127 (USSR)

ABSTRACT: Demountable pulsed lamps of original construction are described. Using these lamps, cinephotography may be carried out at 100,000-150,000 frames/sec. The exposure does not exceed 5×10^{-7} sec. The construction of a linear source is shown in Fig 1a. The discharge takes place between the tungsten electrode, 9, and the brass plate, 10. The length of the spark gap is 20 mm. The tungsten electrode is connected to the lining of the condenser, 4, via the contact ring, 14. The high voltage is applied via the terminals, 2 and 12. The lamp was filled with hydrogen at a pressure of one atm. In the visible part of the spectrum the emission of the lamp is continuous in the interval 4000-6500 Å. The ceramic condensers used had a capacity of 0.0052 μ F and the working voltage was 25 kV. Hydrogen is

Card 1/3

SOV/120-59-2-37/50

A Pulsed Source of Frequently Repeating Flashes of Light

preferred to xenon because deionisation is faster in hydrogen. The length of the lamp is about 30 cm. The lamps have been used to investigate combustion processes in explosive mixtures. The basic circuit for synchronising the explosion with the illuminating flashes is shown in Fig 2. A battery of condensers C_1 , whose capacity is $1.05 \mu F$, is charged up to 22-25 kV. The spark gap A is so chosen that the system is in an "expectation" state. The discharge is initiated by the shutter plate, moving in the direction of the arrow, which closes the primaries of the transformers T_1 and T_2 . When the primary of the transformer T_1 is closed a spark is produced across the spark gap A. The condenser battery C_1 then discharges through R_1 and charges up the ceramic condenser of the lamp. The repetition frequency of the flashes depends on the magnitude of R_1 . This frequency does not remain constant: the greater the ratio of the capacity of C_1 to that of the lamp condenser the smaller is the change in the frequency and the greater is the total number of flashes in the series. In the case when this ratio is

Card 2/3

SOV/120-59-2-37/50

A Pulsed Source of Frequently Repeating Flashes of Light

about 200 the total number of illuminating flashes is about 500. The closure of the secondary of the transformer T_2 fires the explosive mixture to be investigated. By adjusting the position of contacts, the flashes may be synchronised with a particular part of the explosive process. Typical photographs are shown in Figs 3-5. A.S. Predvoditelev and Kh.S. Valiyev are thanked for interest and assistance respectively.

PURPOSE: This book is intended for engineers and scientists engaged
 in developing research techniques and performing experimental
 Card-278

COVERAGE: The book contains the results of original research on
 methods for investigating transient combustion occurring during
 propagation of a flame in a shock tube and of upward motion of
 gas mixtures capable of reaction in a shock tube. The first
 chapter describes circuits of spark discharge apparatus
 and circuits for synchronizing a series of illuminating flashes
 with the processes being investigated. Pulse light sources operating
 in the regime of frequently repeated flashes are described.
 A description is also given of impulse apparatus designed by the
 authors for obtaining a series of Schlieren photographs with a frequency
 of 50,000 to 100,000 frames per second for exposures of the order of 10 sec to permit easy synchronization of the exposure
 with any hydrodynamic process. The construction is shown and an
 analysis is given of the operation of a piezoelectric pressure
 transducer which permits reproducing without distortions the
 shape of a pressure pulse in the case of hydrodynamic disturbances.

Card-278

With the aid of the investigation methods developed, a detailed
 study was undertaken of the mechanism of detonation occurring
 during propagation of a flame in a shock tube and of upward motion of
 gas mixtures capable of reaction in a shock tube. The first
 chapter was written by O. D. Salamandra; in it, a detailed re-
 view of various methods used to produce spark photographs of
 transient processes is given. Certain difficulties which had to
 be met in the course of the investigations are described and
 methods for surmounting them are demonstrated. The second chapter,
 written by S. G. Zaytsev, describes methods for measuring rapidly
 varying pressures developed by the Power Engineering Institute of
 the Academy of Sciences USSR for investigation of the state of
 gas in shock tubes. The methods have found wide application.
 The third chapter presents the results of the investigations con-
 ducted with the aid of the methods discussed on the mechanism of
 the development and propagation of detonation wave under various hy-
 drodynamic conditions. These investigations were recently com-
 pleted at the laboratory for combustion physics by T. V.
 Baranenkov, O. D. Salamandra, R. I. Dolonkin, S. G. Zaytsev,
 I. M. Naboko, and I. K. Sovot'yanyaya. Of particular interest

Card-278

are those investigations which pertain to the conditions of com-
 patibility of the hydrodynamic state of the medium and the chem-
 ical process. A. S. Prevoditely, Professor, Corresponding
 Member of the Academy of Sciences USSR, wrote the preface. There
 are 79 references; 41 Soviet (3 of which are translations), 22
 English, 13 German, and 3 French.

A scientific conference devoted to problems of evaporation, combustion, and gas dynamics of dispersed systems was held at Odessa State University imeni I. I. Mechnikov from 1 to 6 October 1962. Sixty-five papers were presented, 24 of which dealt with the theory and practice of production and stability of aerosols and the effect on these processes of various physicochemical factors: the other 41 concerned working processes in combustion chambers of various power plants. Some of the titles were "Investigating oxidation processes of high hydrogenous fuels by oxygen from compressed air," S. S. Kramarenko; "Burning of metal suspension in hydrocarbon fuels," D. I. Polishchuk, L. P. Letonina, and V. L. Yankevich; and "Experimental investigation of two-phase flow in axially-symmetrical nozzles," G. A. Komov. Included also were discussions of the methods of solving equations of dissociating gas flow in ducts and gas dynamic calculations for jet engines, G. A. Varshavskiy, E. Ya. Guber, and A. P. Kisel'ov; the formation of plane shock waves in shock tubes and passage of shock waves through a flame front, D. V. Fedoseyev, G. D. Sadamandr, and I. K. Sevast'yanova; experimental results on the flow of combustion products of a methane-oxygen mixture around cambered surfaces with diffraction of detonation waves, L. G. Gvozd'ova; the stability of a steady-state flame front S. K. Aslanov; the relationship between the flame and the diameter of a burning drop, V. O. Fedoseyev; and theoretical and experimental investigation of burning of spherical metal particles, by L. A. Klyachko.

TOPIC TAGS: shock wave, detonation, combustion

TRANSLATION: The authors studied the process of transition of slow combustion into a detonation. The experiments were carried out in pipes of circular cross-section 14 to 42 mm in diameter and of square cross-section (36.5 mm x 36.5 mm). The combustible mixtures were of the hydrogen-oxygen, methane-oxygen, and acetylene-oxygen type, since in these mixtures shock waves are formed a short distance from the point of inflamation. The combustive priming was at the closed end of the pipe. Observations were made of the propagation of the perturbations proceeding from the flame and also the flame and the process of accumulation of weak perturbations photographically scanned and also recorded by high-speed photography with a frequency of 100,000 frames per second. Determinations were made of the distances

Title : Inculcating Frost Resistance in Pear Hybrids at Early
Stages of Development.

Orig Pub : Vestn. s.-kh. nauki, 1956, No 3, 65-72

Abstract : New frost-resistant pear varieties are being developed in the Chief Nursery (in Michurinsk) together with vegetative and field hybridization under guidance. The Ussuri pear is the frost-resistant mentor for the pears, and the hawthorn and the black-fruit rowan are also used. Frost-resistance is developed in the seedlings through the influence of lower temperatures on the seeds and seedlings in the beginning of the growth period. Frost-resistance is increased through the effect of the short day on hybrid seedlings. The best results are achieved by the combined

TITLE: Effect of pulsed ruby laser radiation on the cornea

SOURCE: Biofizika, v. 11, no. 2, 1966, 295-298

TOPIC TAGS: eye, medical laser, ruby laser, radiation biologic effect, mouse, neurology

ABSTRACT: The author and F. F. Talyzin previously studied the effect of scattered pulsed white light on the eyes of mice and found morphological and histochemical changes in the eyes of mice and found article gives the results of histological and histochemical investigations of the effects of scattered pulsed ruby laser radiation on the cornea of white mice. The animals underwent single irradiation (a series of 1, 3, 5, 7, 9, 11, 13, 15 or 25 pulses separated by 10-minute intervals), as well as repeated irradiation between series (several such series of pulses, with a 24-hour interval between series). It was established that scattered pulsed ruby laser radiation causes changes in the cornea of white mice, with the degree of these changes being determined by the radiation dose. There apparently exists

Card 1/2

L 41652-65
ACC NR: AP6031119

a certain threshold radiation energy (approximately 0.05-0.1 J/sq cm) below which there is practically no damage in the cornea. The results obtained in repeated exposures to radiation indicate a cumulative effect. Thus, in the case of repeated exposures to series of two pulses each (doses known to be below the threshold energy), both the changes in the cornea and the recovery times are approximately the same as after exposure to a single series of 5-7 pulses. Title : Conditioned reflex changes in diuresis in a dog with a transplanted kidney

Periodical : Fiziol. zhur. 4, 441-444, Jul/Aug 1954

Abstract : Experiments on dogs were conducted to determine how a transplanted kidney reacts to the regulating influence of the cortex. The cerebral cortex regulates urination of a transplanted kidney for forming temporary bonds of positive and negative significance. The ultimate effects of positive and differentiated irritants depend on the magnitude of initial urination. Positive conditioned reflex increases urination and at the same time reduces the specific gravity of urine; it also decreases concentration of creatine and chlorides. Graphs. Six Soviet references.

Title : Herbicides in Vegetable Farming

Orig Pub : Sad i ogorod, 1958, № 4, 23-25

Abstract : In experiments made by the Scientific Experimental Institute of Vegetable Farming excellent results were obtained in the treatment of carrot sowings in the 2-3 leaf stage, using tractor kerosene at the rate of 300 kg/hectare. Rows were sprayed, and in between the rows the soil was treated with cultivators. 98-100% of the weeds were killed. As a result of application of chloro-PC on the 5-6th day after seeding of the carrots (12 kg/hectare of

active ingredients), 53% of the weeds perished. The harvest of carrots on the section treated with chloro-PC was higher than in the control where the vegetables were twice weeded by hand. In treating the rows only with a KRN-2,8 appliance on the cultivator, the herbicide dose could be less than half. In the treatment of onion seeds before sprouts appeared (on the 8th day after sowing) with 16 kg/hectare of chloro-PC, 500.2 centner/hectare of seedlings were obtained, and in the control - 4.8 centner/hectare 8.2% of the weeds were killed. Daisies and everlasting were resistant. On the sowings of carrots and onions excellent results were obtained from the application of TCA. In the treatment of carrots

TITLE: Synthesis and disproportionation reactions of trifluoroborazane derivatives

SOURCE: AN SSSR. Doklady, v. 160, no. 5, 1965, 1101-1103

TOPIC TAGS: borazane, trifluoroborazane, trifluoroborazane derivative, nitrogen substituted derivative, boron nitrogen polymer, synthesis, disproportionation reaction, borazene, difluoroborazene derivative

ABSTRACT: A method was developed for synthesizing and purifying methyl and ethyl derivatives of trifluoroborazane, BF_3NH_3 , and the thermal disproportionation of these derivatives was studied. The organic derivatives of BF_3NH_3 are especially interesting as potential starting materials for preparing thermally stable inorganic polymers with a B-N bond in the main chain. The newly developed method of synthesis was simpler and more reliable than those described in the literature. Trifluoroborazane and its N-methyl and ethyl substituted derivatives were prepared with 82-97% yields by reacting boron trifluoride-diethyl ether in an ethyl ether solution at 5-10°C

Card 1/3

L 32473-65

2

with a corresponding alkyl amine. The products were purified by fractional distillation, mostly in a vacuum, without decomposition. Boiling and melting points of the purified compounds were determined. The melting point of BF_3NH_3 was found to be 152–153°C, a value which disagreed with data in the literature. On heating, BF_3NH_3 decomposes into ammonium fluoroborate and boron nitride. However, disproportionation of the N-ethyl substituted derivatives of BF_3NH_3 led to N-ethyl substituted difluoroborazenes. This fact indirectly confirmed the assumption that BF_3NH_3 , disproportionation occurred in three steps, involving the borazene mechanism, although the intermediate products BF_2NH_2 and $(\text{BFNH})_n$ were not identified. The disproportionation reaction of N,N-diethyl-B,B-trifluoroborazane, $\text{BF}_3\text{NH}(\text{C}_2\text{H}_5)_2$, at 240–320°C, in the presence of certain metals (Al, Mg, Zn,) or without metals, produced N,N-diethyl-B,B-difluoroborazene, $\text{BF}_2\text{N}(\text{C}_2\text{H}_5)_2$, in various yields. Other reaction products were either N-diethylammonium tetrafluoroborate, or hydrogen, or both, depending on conditions. In the presence of sodium, disproportionation yielded diborane, resulting from a break of the B-N bond. Orig. art. has: 3 tables and 5 formulas. [JK]

The utilization of phosphorus from superphosphate by wheat on carbonate chernozem of the steppe portion of Crimea. V. V. Serast'yanova. *Pochvovedenie* 1956, No. 2, 66-74. Comparative field tests were conducted with granular superphosphate vs. the powd. form alone and mixed with $(\text{NH}_4)_2\text{SO}_4$ or NH_4NO_3 (by using the P^{32} isotope) on winter wheat. The powd. form proved to be superior to the granular, and the best of all was the powd. form mixed with NH_4NO_3 . By applying the superphosphate at the termination of tillering, the plants utilized only 20% of the added phosphate, the rest came from the native soil phosphate. 17 references.

TITLE:

The Selection of Type and Design . of Electric Slag-Welding Apparatus (O vybore tipa i konstruktsii apparatov dlya elektroshlakovoy svarki)

PERIODICAL:

Avtomatischekaya svarka, 1959, Nr 1, p 8-17 (USSR)

ABSTRACT:

Present electric welding equipment does not satisfy modern requirements of USSR industry in regard to its facility of use and technical perfection. Its nomenclature is rather varied and, therefore, almost unsuitable for the organization of serial production. Welding equipment has to be perfected and standardized, and the five-years of experience gained in the production and use of electric slag-welding apparatus has to be taken into consideration. The universal welding apparatuses A-535 and A-501-M, developed by the institut elektrosvarki im. Ye.O. Patona (Electric-Welding Institute imeni Ye.O. Paton), help considerably to solve the above mentioned problems. Upon completion, they will be recommended for serial production in conjunction with a number of other welding apparatuses. The A-501-M

Card 1/3

25(1)

The Selection of Type and Design of Electric Slag-Welding Apparatus

SOV/125-59-1-2/15

apparatus (Fig 2), a further-developed model of the A-501-type apparatus, is designed for wire-electrode welding of straight-lined angle, seam and T-type metal fusions on metals measuring up to 150 mm in thickness. The apparatus moves directly over the work piece and is held in any position by two electromagnets connected with each other by means of an eccentric shaft. Upon rotation of the shaft, the magnets alternately move off from the welded body and operate along it toward the welding. The A-535-type universal welding apparatus (Fig 3) is designed for electric slag-welding of straight-lined and ring-butt joints of T-type and angular metal fusions (on metals measuring up to 500 mm in thickness) by means of wire electrodes. Up to 800 mm thick metals may be welded by plate-type electrodes. The apparatus welds double-sided and is operated

TITLE: Automatic Machine for Assembling and Welding of Hollow Balls

PERIODICAL: Avtomaticheskaya svarka, 1959, Nr 7, pp 77-80 (USSR)

ABSTRACT: In 1958, the Paton Institute of Electric Welding constructed an automatic machine for assembling and gas-electric welding of hollow steel balls. The balls consist of two semi-spheres of 20 cm in diameter; they are stamped of steel sheets. Such balls are used in big quantities by machine- and shipbuilding works. The weld connecting both semi-spheres should be very strong; it must stand a pressure of up to 50 atm. As a method of semi-sphere joining, gas-electric welding was selected in protective atmosphere of carbon dioxide. The processes of assembling, welding, as well as the auxiliary operations are performed by the new machine automatically. The parameters of the welding process are: 1) electrode wire 1 mm in diameter;

TITLE: Scientific-Technical Conference on Questions of Welding Engineering

PERIODICAL: Avtomaticheskaya svarka, 1959, Vol. 12, No. 5 (74)
pp. 95-96 (USSR)

ABSTRACT: The scientific-technical conference on question of welding engineering convened in Khar'kov from March 11-13, 1959. The following organizations convened in the conference: The Scientific-Technical State Committee of the Council of Ministers of the USSRSSR, the Khar'kov Sovnarkhoz, the Institute of Electric Welding URSRR, the Paton's Academy of Science of the MTO or the machine industry. After the introduction of the Chairman of Gossi URSRR, G.P. Kotenko, the conference heard the report of Academician A.G. URSRR, Ye. Paton "On the Reintroduction and Production of Welding Engineering". After that, the following reports were heard at the conference: Member of Gos Plan URSRR D.I. Polyakov on establishing materials and engineering bases in the republic for the development of welding; Vice Chairman of Sovnarkhoz V.N. Yakovlev on the introduction of welding engineering in the enterprises of the Donets economic administrative area. Chief of Technical Administration of the Khar'kov Sovnarkhoz I.L. Ruzubayev on the introduction of progressive welding engineering in the enterprises of the Sovnarkhoz. Comrade Ratnikov on successes of the Zaporozhye Metal Construction Factory in introducing welding engineering; Candidate of Technical Sciences I.I. Prudan (Institute of Electric Welding) Imanli Ye. O. Paton on new work on automatic welding; Chief of Welding Department of the Kremenchuk Machine Factory V.K. Yermakova on the use of "Electric Slag" welding in heavy machine building; Candidate of Technical Sciences Yu. A. Vysotskaya on ceramic flux for welding; Chief of Welding Department of Khar'kov Turbines Society, S.I. Gurevich on the use of radioelectric welding in carbon dioxide. Candidate of Technical Sciences P.I. Serio on new equipment for welding; worked out by the Institute of Electrical Welding Ye. O. Paton, Candidate of Technical Sciences V. I. Lebedev (Institute of Electric Welding) on new work on point welding; Ivanov I. I. Paton on new welding equipment, worked out by VNIIEGO. Vice Director of the Institute of Avtogen, Candidate of Technical Sciences A. Antonov on recent achievements in the gas flame treatment of metals. Candidate of Technical Sciences N.F. Katskov (Chair of Technology of Metals at Moscow Institute of the Meat and Milk Production) on a new method of vacuum diffusion welding.

TITLE: Machine for Automatic Welding of Oval Welds

PERIODICAL: Avtomaticheskaya svarka, 1959, Vol 12, Nr 6 (75)
pp 79-83 (USSR)

ABSTRACT: The author presents the construction of a machine for the ring shaped, oval welds. The main parts of this machine are : (Fig 1) profiling wheel; electric drive with leading roller; supporting idle roller, the radius of which equals the smaller radius of the oval; limiting idle roller; balance weight; two supporting columns and frames. The profiling wheel has two running tracks: an outer one, on which rolls the leading roller of the electric drive mechanism, and an inner one, for the supporting idle roll. The outer running track appears as a closed oval, equal to the oval of the products. The inner running track runs parallel to the outer. There are 4 diagrams

Twelfth Annual Assembly (Cont.)

COVERAGE: The collection contains abridged reports presented and discussed at the Twelfth Annual Assembly of the International Institute of Welding. Reports deal with problems of welding and related processes used in repair work, repair techniques, and the problems arising in connection with the nature of the base and filler materials. Examples of repairing various parts are given, and the organization of repair operations in workshops and under field conditions is discussed. Economic aspects of welding and related processes as used in repair work are analyzed. No personalities are mentioned. There are no references.

AUTHOR: Sevbo, P.I., Candidate of Technical Sciences

TITLE: On Complex Mechanization and Automation of Assembling and Welding

PERIODICAL: Svarochnoye proizvodstvo, 1960, No. 6, pp. 1 - 6

TEXT: The author discussing the progress of overall mechanization and automation of welding suggests a method of determining the productivity of individual welding units and their influence on welding economy in general. In Formula (1) $m = \frac{T_1}{T_o}$ the influence factor (m) of the individual efficiency (T_1) on overall assembly and welding productivity (T_o) is expressed. Equation (2)

$$K = \frac{1}{1 - m + \frac{m}{n}}$$

shows the individual efficiency increase (n) and the resulting overall capacity increase (K). The productivity of various capacity units is determined by equation (3)

$$K = \frac{1}{1 - \sum m + \sum \frac{m}{n}}$$

AUTHOR: Sevbo, P.I., Candidate of Technical Sciences

TITLE: Is Pipe-Expanding Really Useful?

PERIODICAL: Stroitel'stvo truboprovodov, 1960, No. 10, pp. 8-9

TEXT: The author opposes the idea that hydraulic pipe expanding strengthens the metal, is a good method of testing the strength and of calibrating pipes transversally and longitudinally. Expansion increases the yield point, but not the tensile strength; since the carrying capacity is based on the strength of the pipe and not on the yield point, expansion does in no way improve the pipe, on the contrary: it has been observed that an artificially increased yield point lowers the plasticity of the pipe and is apt to render the metal brittle. Expanding can cause local deformation which in turn can result in greater strain, excessive hardening and even cracks. Expanding is not a good method of testing pipes, since it is likely to open hidden cracks predisposing the pipe to breakage not only during service but also in the course of transportation and assembly. Pipes should undergo the same kind of hydraulic tests as boilers, viz., not exceeding the yield point. Expanding cannot be considered a suitable means for calibration. The author describes the operations of manufacture of pipes
